Glossary

Customer Service Officer	Employee that initiates the planning request. Fills the request and redirects it to the Senior Customer Service Officer.
Senior Customer Service Officer	Employee that is responsible to do the first review of a request and either reject or redirect it to the financial manager.
HR Team	The team that is responsible for keeping the employee records and finding additional human resources when necessary.
Marketing Team	The team that is responsible for keeping client records and producing insights about clients and events.
Administration Team	The team that coordinates Marketing , Customer Service and HR teams to effectively organize events.
Financial Manager	The employee responsible for budgeting and allocating financial resources.
Production Manager	The employee responsible for handling the digital assets of an event. Also responsible for decorations.
Service Manager	The employee responsible for handling food and drink for an event.
Vice President	The employee that is responsible for keeping track of financial and employee KPIs .
Planning Request	The form that keeps all the required information about an event in one place. Each department updates the information that is relevant to their job.
Client Record	All information about a client that is kept in the system.
Employee Record	All information about an employee that is kept in the system.
Report	A document listing data about a certain event/employee/client. Usually generated by the Vice President or the Administration Team.
Task	A specific unit of work that needs to be done by the Service or the Production team. Usually generated by the respective manager of the team.

Hiring / Outsourcing Request	A request sent to HR when additional human resources are needed. Usually generated by either the Service or Production Managers.
Budget Adjustment Request	A request sent to the Financial Manager when additional budget is required. Usually generated by either the Service or Production Managers.
Discount	A special price for an event. This is decided by the Financial Manager when a client has done enough events with the company.

Actors

- Customer service Officer
- Senior Customer Service Officer
- HR Team
- Marketing Team
- Administration Team
- Financial Manager
- Production Manager
- Service Manager
- VP

Scenarios

Initiate planning request

Larry, the representative of IEEE, wants to make a conference in Stockholm. To do this he contacts Swedish Events Planner (SEP) and starts talking with the customer service team, more specifically Sarah, a customer service officer. They talk about what he needs for the event and Sarah writes down all the data.

After the conversation, Sarah logs into the system successfully and accesses the main dashboard. From the dashboard, Sarah selects the "New Planning Request" option from the menu and the system presents her with a form to fill out the necessary information. Sarah fills all the information about the event (type, start and finishing date, decorations, filming, food, beverages, etc.) and the system verifies that all required fields are filled correctly. After completing the form, the system presents a summary of the entered data to Sarah, who reviews the inputted details and makes changes if necessary. Sarah saves the planning request by pressing the "Save" button and the system confirms that the planning request has been saved successfully and stores the request in the system's database.

Review Planning Request

Janet, the Senior Customer Service Officer, logs into the system successfully and accesses the main dashboard. From there she opens the list of pending planning requests and chooses one. The system presents the details of the selected planning request and Janet carefully reviews the information. Since the request had the special requirement of 3 elephants, Janet automatically rejects the request by pressing the "Reject" button because she finds it not feasible. The system marks the request as archived and closes the request window.

Make discount to old clients

Alice, the financial manager, logs into the system successfully and accesses the main dashboard. From there, she opens the list of pending planning requests and chooses one. Alice goes to the "Search client" page and searches for the client in question. She sees that the client is a frequent one and decides to apply a 15% discount. The financial manager updates the request with the discounted price.

Employee not found

Simon, the senior HR manager, logs into the system successfully and accesses the main dashboard. He wants to look up Sam, a customer service officer, to see how many deals he has made with clients. Simon clicks the button “Search employee” and then clicks on the search bar and writes “Som” instead of “Sam”. The system doesn’t recognise the employee and automatically pops up an error window saying “Employee Not Found”.

Use cases

Name: Initiate Planning Request
Participating Actor: Customer Service Officer
Entry Condition: User is logged in the system
Exit Condition: User has created a planning request
Quality Condition: The system should be available and functioning
Event Flow: 1. User presses the menu option to initiate a new planning request 2. User enters all required information about the client needs for this request in the form 3. User reviews the information 4. User saves the planning request

Name: Review Planning Request
Participating Actor: Senior Customer Service Officer
Entry Condition: User is logged in the system
Exit Condition: User either rejects or redirects the planning request
Quality Condition: The system should be available and functioning
Event Flow: 1. User selects a planning request from the list of pending requests 2. User reviews the information written in the request 3. User can either reject the request or redirect it to the financial manager. 4. In the case that the request is redirected, the financial manager is notified about the request.

Name: Update Planning Request
Participating Actors: ● Senior Customer Service Officer ● Administration team ● Production Manager ● Service Manager ● Financial Manager
Entry Conditions: User is logged in the system
Exit Condition: User saves an updated planning request.
Quality Condition: The system should be available and functioning
Event Flow: 1. User selects a planning request from the list of open requests 2. User updates the details written in the planning request. 3. User saves the updated planning request.

Name: Send Request for Budget Adjustments
Participating Actors: ● Production Manager ● Service Manager
Entry Conditions: User is logged in the system
Exit Condition: User creates a new budget assignment request
Quality Condition: The system should be available and functioning
Event Flow: 1. User creates a new budget adjustment request 2. User associates the budget adjustment request with an event planning request. 3. User fills the required information about the budget adjustments and the reasoning for them. 4. User submits the budget adjustment request. 5. The Financial Manager is notified about the new request.

Non-functional requirements

- The system should maintain an uptime of 99%.
- The system should keep daily backups of its data.
- The system should be secure, meaning that unauthorized users cannot perform any action.
- The system should have the capacity to store and manage data for at least 100.000 events.
- The system should be accessible on various devices.
- The system should be able to export all the various reports in PDF format.
- The system should track which user performed each action made.
